

PRESS RELEASE

North Star Job Hunt launches AI-assisted workspace to help candidates cut through job-search fog

Colne, Lancashire, UK - 2026 - North Star Job Hunt has launched as a candidate-first career platform designed to help jobseekers organise their search, discover live roles, improve applications, and use AI support without losing human control.

Created by Mike, an IT professional from Colne, Lancashire, North Star Job Hunt began as a personal project during a difficult job search in 2025. After struggling with scattered job boards, spreadsheets, ghosting, and repetitive applications, Mike used AI-assisted development tools to build the workspace he wished he had at the time.

The platform brings together live job search, CV support, interview preparation, salary tools, saved roles, and guided AI assistance. Its focus is not blind automation, but safer career support that helps candidates understand opportunities and make better decisions.

Key features

- Live job search across North Star roles and selected external listings.
- CV and application support built around evidence and gap analysis.
- Interview coaching and career planning tools.
- Saved role workspaces for tracking applications and next steps.
- Transparent AI notices and human-in-the-loop controls.
- Data portability and user-controlled deletion options.

"I built North Star because I was tired of the job-search fog. The goal is simple: help candidates feel more organised, more prepared, and more in control. AI can be useful, but it should support the person, not take over their career." - Mike, creator of North Star Job Hunt

North Star Job Hunt is now live at <https://northstarjobhunt.com>.
